NAME : Kashid Aryan Vijay

ROLL NO. 2401042

T12 – AI&DS

SUB : ASD&D Lab

EXPERIMENT – 5

AIM : To automate application deployment using Github/Jenkins.

LO MAPPED : LO3.

LO3 : Build and manage automated CI/CD pipelines for application development, testing,

Packaging and deployment.

THEORY :

Continuous Integration and Continuous Deployment

CI/CD is a software development methodology that automates the process of taking source-code changes from development to a deployed application. It minimizes manual tasks and makes software delivery faster and more reliable.

Continuous Integration (CI):
Continuous Integration involves regularly adding developers' code changes to a common repository. Each change can be automatically built and tested, which helps detect errors early and keeps the project in a stable state.

Continuous Deployment (CD):
Continuous Deployment is the next stage of the CI process, where code that successfully passes the required checks is automatically delivered to the target environment. This avoids the need for manually transferring application files.

Jenkins:

Jenkins is an open-source automation tool used for performing tasks such as building, testing, and deploying applications. It can connect with source-code repositories like GitHub and execute the stages defined in a pipeline.

Jenkins Declarative Pipeline:

A Declarative Pipeline defines the CI/CD process in a structured manner using a Jenkinsfile. Different stages such as Build, Test, and Deploy can be specified in the file. Storing this configuration along with the application source code makes the process repeatable.

GitHub:

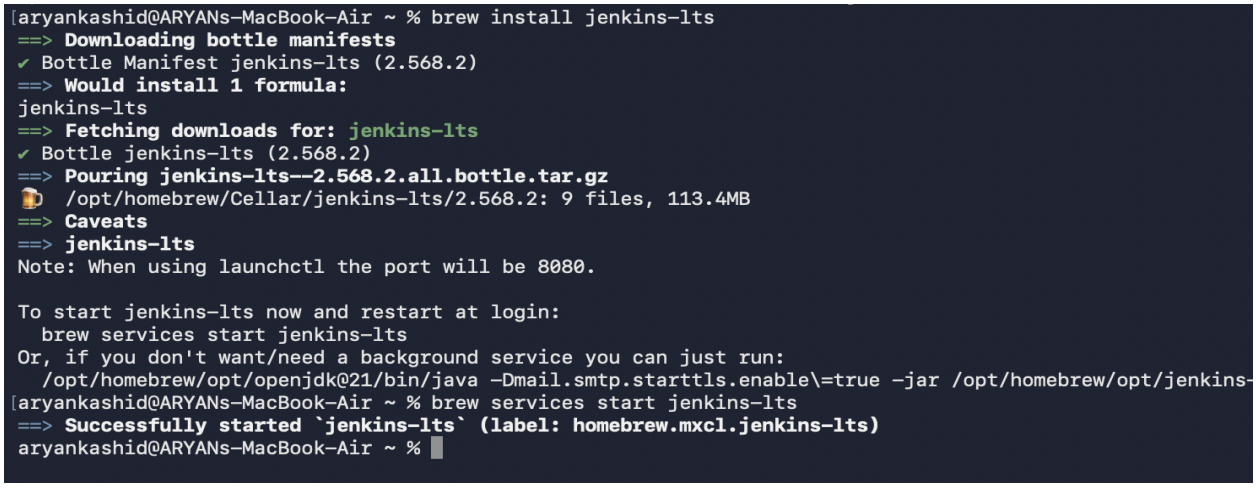

GitHub is a remote repository used to store and manage application source code. In this experiment, Jenkins obtains the application files and pipeline configuration from the GitHub repository.

CI/CD Flow:

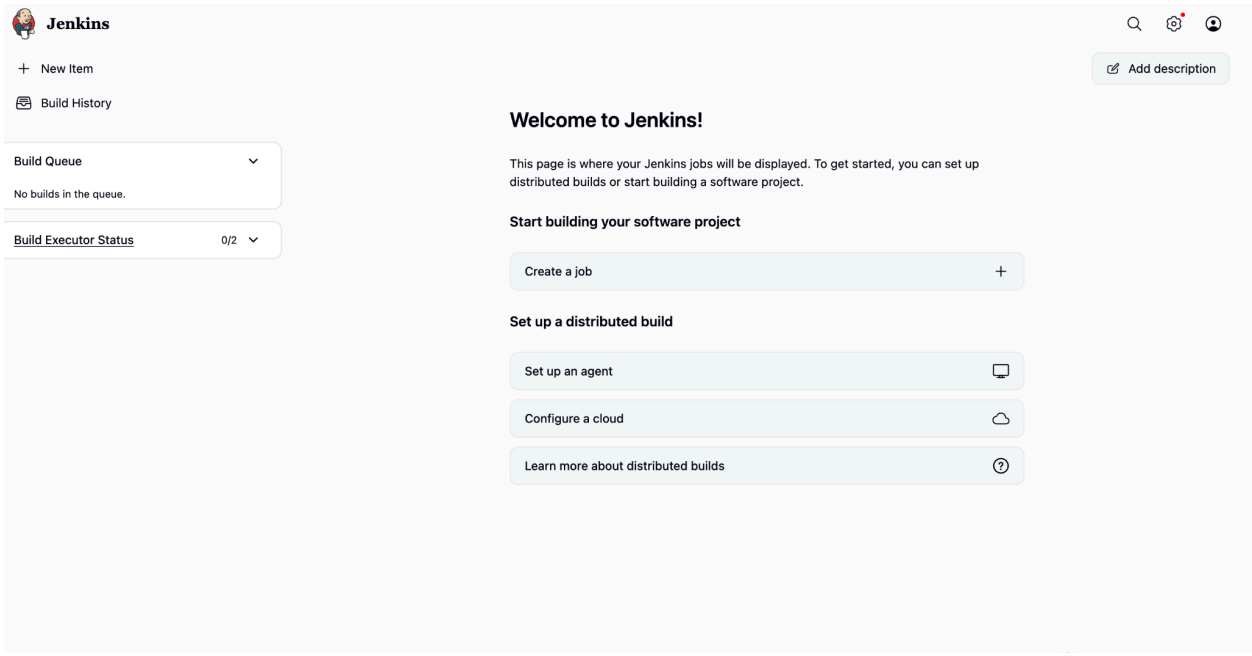

Developer modifies code → GitHub Repository → Jenkins fetches code → Build → Test → Deploy → Updated Application

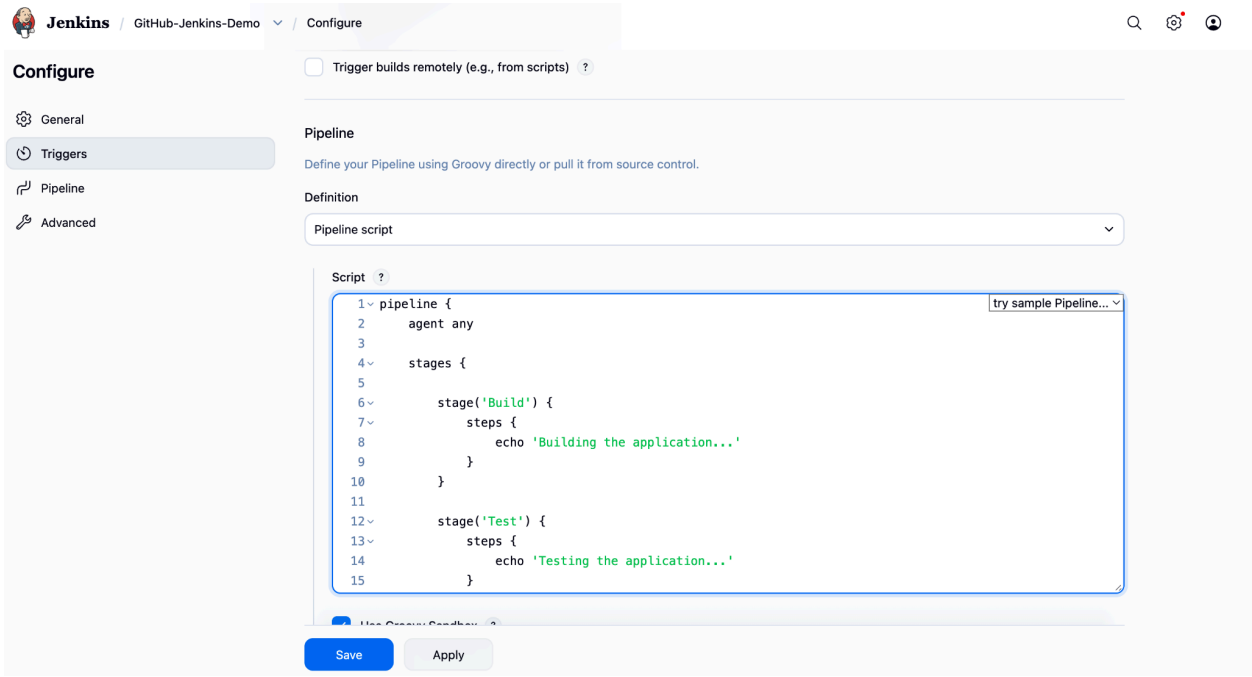

EXECUTION :

Step 1: Jenkins Initialization and Setup

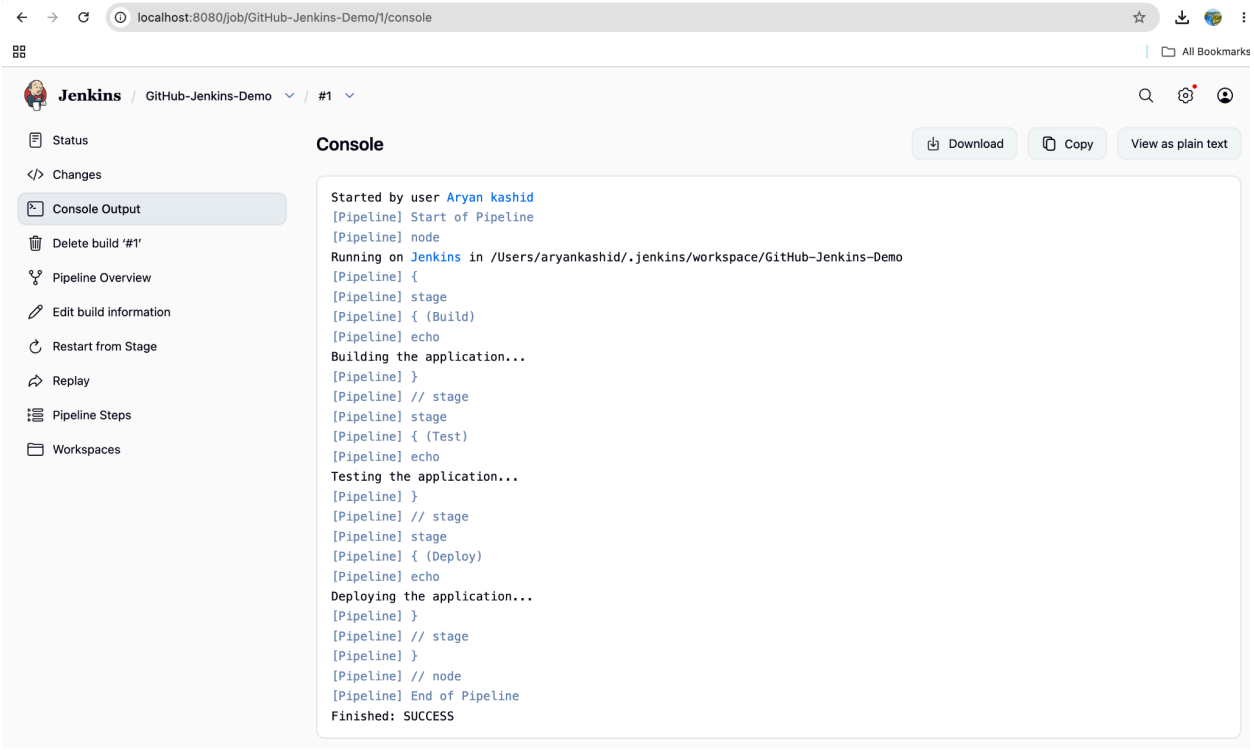

Step 2: Jenkins Pipeline Creation and Initial Validation

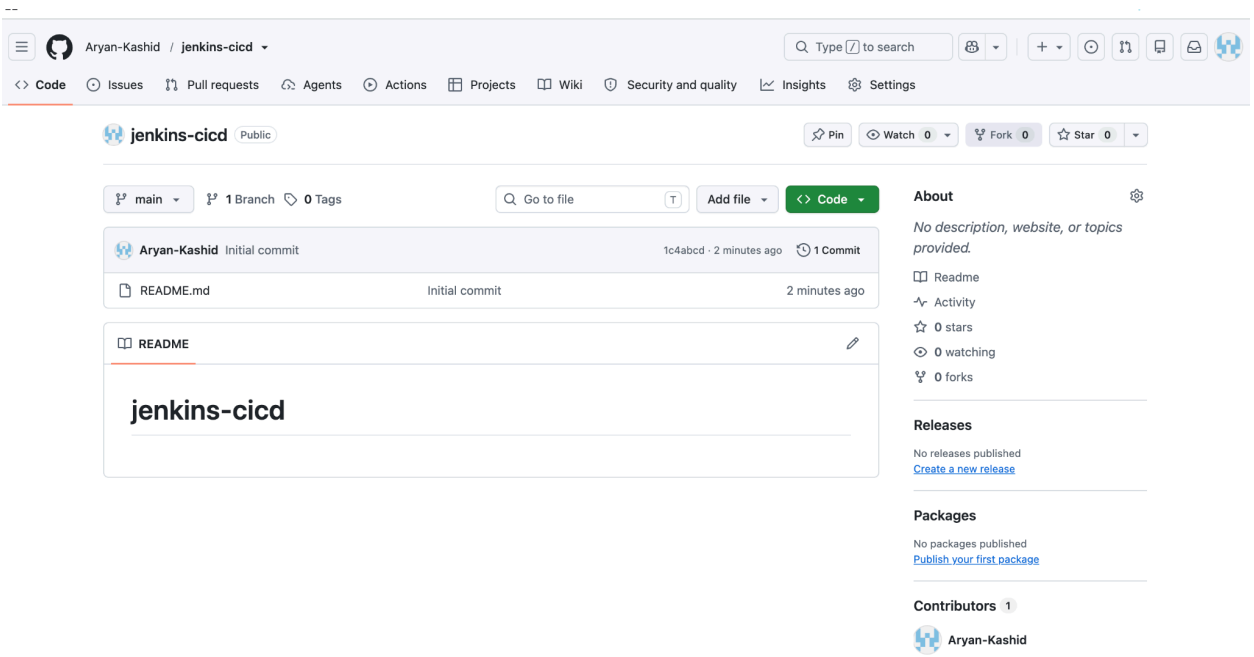

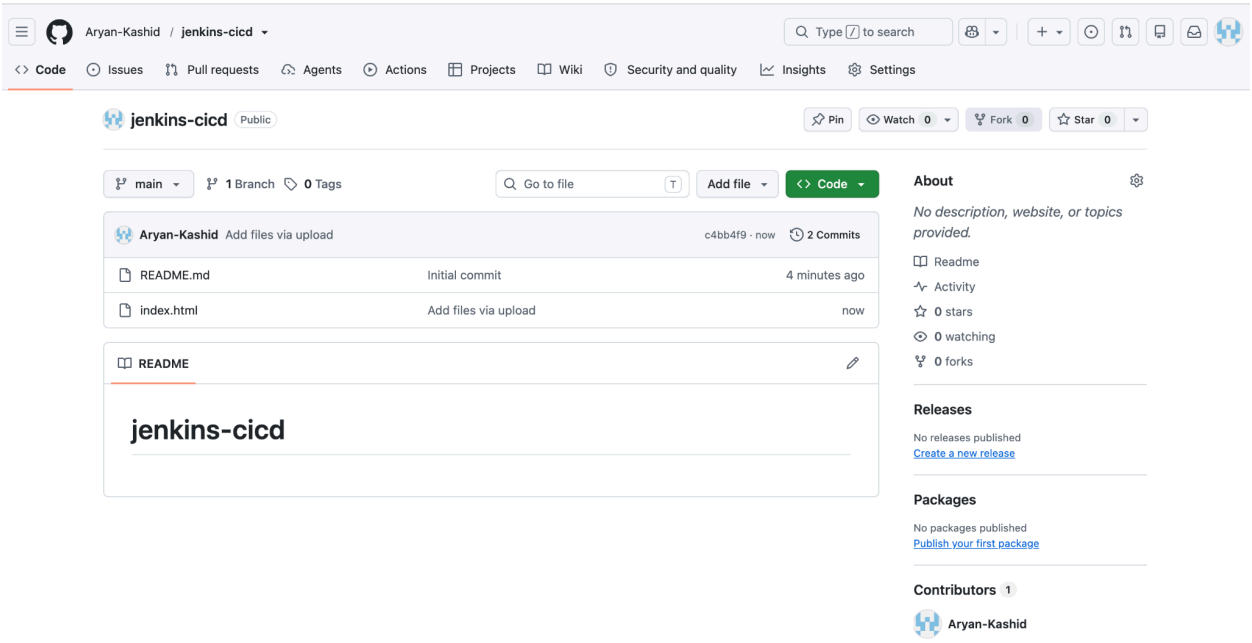

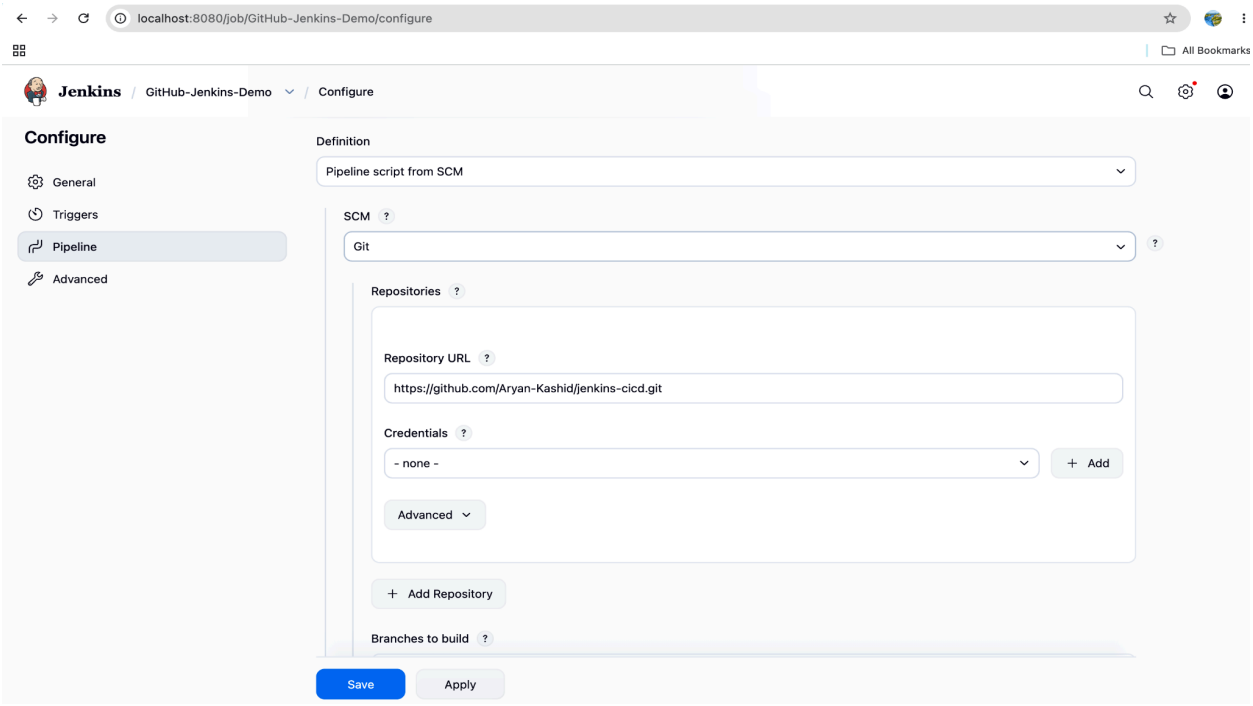

Step 3: Initial Pipeline Execution

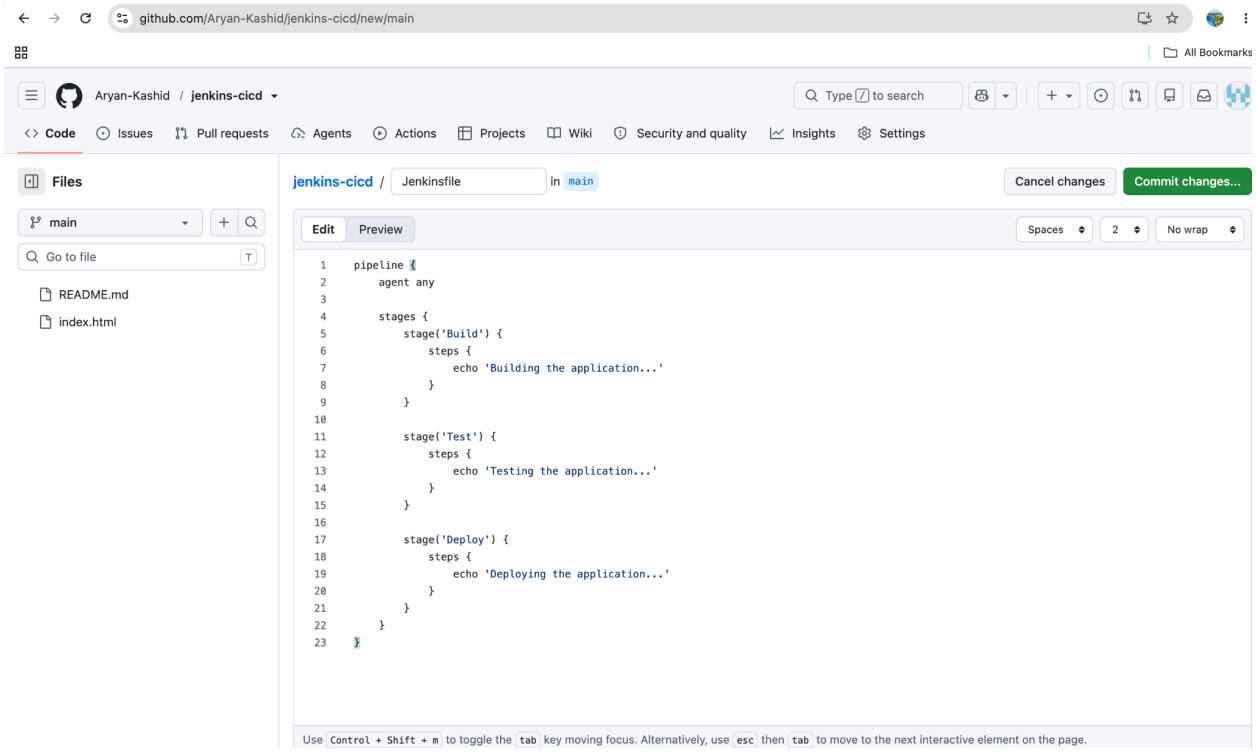

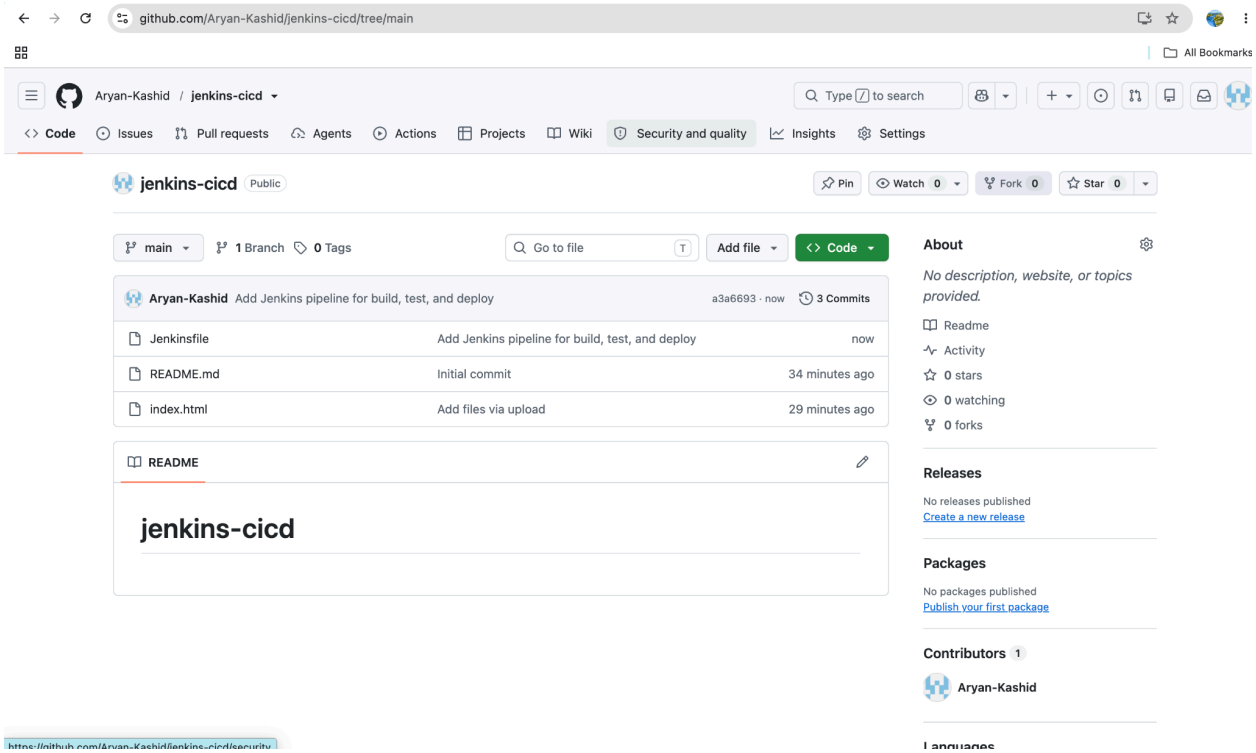

Step 4: GitHub Repository and Jenkinsfile Configuration

Step 8: Final Deployment Verification

CONCLUSION :

The experiment successfully demonstrated how GitHub and Jenkins can be combined to automate application deployment. By using a Declarative Jenkinsfile, the Build, Test, and Deploy tasks were organized into a repeatable pipeline, reducing the need for manual deployment.

The initial application as well as its modified version were successfully deployed through the pipeline. This showed that changes made in the GitHub repository could be automatically processed by Jenkins and delivered to the deployment environment. Overall, the experiment provided practical knowledge of CI/CD, Pipeline as Code, GitHub integration, and automated software deployment.
